## BEST AVAILABLE COPY

What is claimed:

A non-invasive method for measuring the velocity
 of a free fluid surface flowing in a predetermined direction in an open channel or flume of a fixed shape comprising the steps of:

generating a microwave frequency electrical signal adapted to reflect from said fluid surface using a means to generate said electrical signal;

spacing the means to generate said electrical signal from said fluid surface;

directing said signal along a line toward the fluid surface and opposite the predetermined direction and at an angle of between 30 and 40 degrees to said fluid surface;

detecting the signal reflected from the fluid surface; and

determining from the directed and reflected signal the Doppler frequency shift therebetween as a measure of the velocity of the fluid surface.

2. The method of claim 1 wherein said directed signal forms a pattern on the fluid surface of an oval shape.

3. The method of claim 2 wherein said spacing is 30 arranged so that said directed signal has an unobstructed cone-shaped view of the fluid surface.

4. The method of claim 3 wherein said spacing is generally between 18 and 48 inches.

5. The method of claim 1 comprising the additional 35 steps of:

measuring the depth of the fluid in the channel or flume; and

determining from the velocity of the fluid surface and the depth of the fluid in the channel or flume, the flow rate of the fluid.

6. The method of claim 5 wherein the depth measurement is ultrasonically obtained.

The method of claim 6 wherein said ultrasonic measurement is non-invasive.

45 8. The method of claim 7 wherein said non-invasive method includes the steps of:

generating an ultrasonic acoustic signal adapted to reflect from said fluid surface using a means to generate said ultrasonic signal;

50 spacing the means to generate said ultrasonic signal a predetermined distance above the open channel or flume bottom and above the fluid surface;

directing said ultrasonic signal downwardly at said fluid surface;

detecting the ultrasonic signal reflected from the fluid surface; and

60

determining from the reflected ultrasonic signal the difference in length therebetween the open channel or flume bottom and fluid surface as a measure of the depth of the fluid in the open channel or flume.
